                                                                                                                                                                                                                                                                    The present sequence represents a human interleukin-1 (IL-1) polypeptide. The IL-1 polypeptide is used in the method of the invention. The specification describes a method for inhibiting leukocyte infiltration or cartilage degradation in a joint of a mammal. The method comprises administering a viral vector encoding a protein of interest, such that expression of the protein within the joint results in an inhibition of leukocyte infiltration or cartilage degradation in the joint. This protein is an IL-1 receptor antagonist (IRAP), soluble IL-1 receptor, soluble tumour necrosis factor-alpha (TNF-alpha) receptor. IL-10, or their biologically active fragments or derivatives. The method is used for treating connective tissue disorders by inhibiting leukocyte
                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Inhibiting leukocyte infiltration or cartilage degradation in mammalian joint, comprises administering a viral vector comprising a nucleotide sequence operably linked to a promoter encoding a protein of interest
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            A human interleukin-1 (IL-1) receptor polypeptide

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to a method for diagnosing a disorder characterised by expression of a human cancer associated antigen precursor coded for by a nucleic acid molecule (NAM). The method comprises: (a) contacting a a nucleic acid molecule (NAM). The method comprises: (a) contacting a biological sample isolated from a subject with an agent that specifically binds to the NAM, an expression product or a fragment of an expression product complexed with an HLA molecule; and (b) determining the interaction between the agent and the NAM or the expression product as a interaction between the agent and the NAM or the expression product as a determination of the disorder. The products and methods can be used in the diagnosis, monitoring, research, or treatment of conditions characterised by the expression of various cancer associated antigen sequences and encoded polypeptides the invention provides nucleic acid sequences and encoded polypeptides which are cancer associated antigen precursors expressed in human breast cancer, renal cancer, colon cancer, gastric cancer, prostate cancer and line of the cancer and cancer and cancer and cancer and cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             15-JUL-1998;

The invention relates to a method for identifying a compound capable of affecting the binding of a syntaxin-binding protein, e.g. SNAP-25, alpha-SNAP, n-secl or VAMP, to syntaxin. The method comprises measuring the effect of the test compound on the extent of binding between the SBP and the SBP-binding site on syntaxin. The method can be used for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Screening assay for modulators of syntaxin binding - using peptide comprising binding site of syntaxin, for identifying drugs useful for treating CNS disorders, neuro-degenerative diseases, etc
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Disclosure; Column 51-54; 57pp; English.

The prostate cancer antigen polynucleotides may be used for detection of prostate cancer, chromosome identification, as chromosome markers, and for numerous other diagnostic or research purposes. The prostate cancer antigens may be used to treat disorders such as neural, immune, muscular, reproductive, gastrointestinal, pulmonary, cardiovascular, renal, and proliferative disorders, wounds, and infectious diseases.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The mature HCAVIII protein (AAR91951) was produced as a GST fusion in Escherichia coli cells transformed with the encoding cDNA (AAR15449) cloned into pGEX4T-1. It was isolated by affinity purification and thrombin cleavage. HCAVIII is a cell surface antigen which is highly specific for non-small cell lung cancer, and which shares regions of homology with human carbonic anhydrases. It can be used to produce antibodies of therapeutic or diagnostic application.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Claim 7; Page 44-46; 87pp; English.

                                         A cDNA sequence (AAT15454) codes for a phosphorylation-modified form (AAR91955) of HCAVIII, a cell surface antigen which is highly specific for non-small cell lung carcinoma (NSCLO) and which has features in common with human carbonic anhydrases. The modified HCAVIII has glycine substituted for serine at position 302 of the mature protein. It is used to study the role of HCAVIII serine

 Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                        Score

CYTOPLASMIC MEMBRANE, PLAY A ROLE:IN TRANSPORTING TRYPTOPHAN CYTOPLASMIC MEMBRANE. PLAY A ROLE.IN TRANSPORTING TRYPTOPHAN CYTOPLASMIC MEMBRANE PROTEIN. INNER MEMBRANE.

-!- SUBCELLULAR LOCATION: INTEGRAL MEMBRANE PROTEIN. INNER MEMBRANE.

-!- INDUCTION: BY TRYPTOPHAN. IS SUBJECT TO CATABOLIC REPRESSION.

-!- SIMILARITY: BELONGS TO THE MTR / TNAB / TYRO PERMEASE FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 TNAB_ECOLI

J. Mammal. 75:365-377(1994).

-i. FUNCTION: COMPONENT OF THE UBIQUINOL-CYTOCHROME C REDUCTASE COMPLEX (COMPLEX II OR CYTOCHROME B-C1 COMPLEX), WHICH IS A RESPIRATORY CHAIN THAT GENERATES AN ELECTROCHEMICAL POTENTIAL COUPLED TO ATP SYNTHESIS.

COUPLED TO ATP SYNTHESIS.

-i. COFACTOR: TWO HEME GROUPS (B562 AND B566) WHICH ARE NOT COVALENTLY POCHAIN TO THE DECRETARY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This SWISS-PROT entry is copyright.
